TITLE: The Use of Radioactive Isotopes for the Purpose of Solving
the Problem of Increasing the Service Life of Machine Parts
and Mechanisms 14 ✓
PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1960, Vol. 3, No. 11,
pp. 113-119

TEXT: In the introduction, the use of radioactive elements as indicators for wear is discussed in a general manner. In this connection, the activation of the parts investigated is described as an essential problem, i.e., irradiation in an atomic reactor and the applying of radioactive substances onto the surfaces under investigation. The advantages of an irradiation in a reactor are compensated by the disadvantages of the change of various physico-mechanical properties of the material under investigation. This method is only very little used in the USSR. The difficulties in the case of the second aforementioned method consist in the fact that the radioactive elements, which are used for this purpose in form of alloys with

 the Service Life of Machine Parts and Mechanisms

Fe⁵⁹, Co⁶⁰ or Zn⁶⁵ have a low activity and that the production of equal or similar alloys with these elements is difficult. Another fact of great importance is the quantitative measurement of the radioactive particles, which is mostly carried out with scintillation counters. As an example, an investigation of the operation conditions of a tractor motor with respect to the wear of piston rings is dealt with. A scheme of the experimental setup is shown; the contact surfaces were activated by means of a Co⁶⁰ and Zn⁶⁵-containing alloy. It is found that at a definite number of rotations of the crankshaft wear is the greatest. The investigation of the wear of further motors is partly dealt with, several details are briefly discussed, and finally, testing in practical operation is described as an especial advantage. From the investigation of a tractor of the type DT-54 (DT-54) the results obtained are shown in a diagram. Piston rings show the greatest wear among all parts investigated. There are 4 figures and 10 Soviet references.

TITLE: Conference on the Application of Powerful Radiation
Sources In Industry and Especially in Chemical Processes

PERIODICAL: Atomnaya energiya, 1960, Vol 8, Nr 2, pp 164-167 (USSR)

ABSTRACT: The conference was held in Warsaw September 8-12, 1959. More than 200 representatives from 27 countries were present. The representatives of Canada reported on the radiation source and construction of the irradiation unit for irradiation of potatoes. The use of a powerful irradiation unit with cobalt 60 as the radiation source in the rubber and plastics industry was reported by representatives of Czechoslovakia. Several reports were devoted to methods of calculating and designing irradiation units for use in the chemical industry (Denmark, Hungary, USSR, France). The outstanding reports of the representatives of the U.S. were: G. Silverman, on the use of β -radiation of fission products in textile and

plastics industries; D. George and D. Gregory, on the γ -unit of the research center of the Australian Atomic Energy Commission; G. Oster, on "The Role of Electron Excitation in the Chemical Effect of Irradiation on Plastics"; J. Sederland and A. Allen, on radiolysis of pentane in the crystal lattice of hydrated synthetic zeolites; E. Taylor, on the effect of γ -radiation on the activity of catalysts; A. Henglein, on synthesis of nitric compounds by the reaction of free radicals with nitrogen oxide; E. Pollard and U. Gild, on inactivation curves for certain plants, animals, and bacteriological viruses; Ch. Artandi, on sterilization of pharmaceuticals and hospital equipment with ionizing radiation; P. Ebersold, on main types of industrial application of radiation in the U.S. and future plans for the use of radiation. Several studies conducted at Brookhaven and Oak Ridge National Laboratories were also reported. The reports presented by representatives of Japan are: S. Onisi, on measurements of spectra of the

electron spin resonance of γ -irradiated polymers;
M. Matsumoto, on the effect of radiation on polyvinyl
alcohol; S. Okamura, on polymerization of vinylacetate
in an aqueous medium under the effect of γ -radiation.
The Soviet reports mentioned are: A. K. Breger, on the
principle and general characteristic of indium-gallium
irradiator using short-life isotopes; S. S. Medvedeva,
A. D. Abkina, and P. M. Khomikovskiy, on radiation poly-
merization of ethylene in gaseous phase of organic
solvents. The other reports noted are: S. Pinner (U.K.),
on synthesis of polyvinyl chloride with copolymer chains
cross-linked with allyl bonds; F. Dalton and R. Robetson
(U.K.), on graft-polymerization of polyacrylonitrile and
dimethylsiloxane caused by γ -radiation; H. Heins and
B. Dere (Belgium), on the effect of γ -radiation on
polyethylacrylate of various molecular weights; F. Trenar
and Verrie (France), on the effect of radiation on the
reaction of chlorine with one of its liquid derivatives;
F. Balestic and M. Maga (France), on the effect of radia-
tion on synthesis of some dyes.

TITLE: New Hermetic Chambers for Working With α - and β -Active Substances 19

PERIODICAL: Atomnaya energiya, 1960, Vol. 9, No. 4, pp. 344 - 347

TEXT: The authors give a detailed description of the chamber 1KHJK (1KNZh), mass-produced in the USSR, in which it is possible to work with α - and β -active substances. In this chamber, which has one working place, it is possible to work at high temperatures, and also with acids and lyes. (A similar chamber of the type 2KHJK (2KNZh) with two working places is shown in Figs. 4 and 5). The chamber is made of 3 mm thick stainless steel, and is 2320 mm high, 875 mm broad, and, including the antechamber, 1270 mm long. The hermetically sealed space in the chamber is 0.4 m³. The chamber itself stands on a foundation made of carbon steel. Figs. 1 and 2 show the front and the back of the chamber. Chambers of this type are produced with one or two antechambers which are used for introducing and removing the radioactive materials, the vessels, reagents, etc. The

inside of the chamber is lighted with a three-tube lamp (45 w) of the type ЦЛС-45 (SDS-45). For protection against radioactive aerosols, gases, and other substances in the air, the chamber is equipped with a special two-stage filter system, which is described. A receptacle is inserted in the foundation of the chamber (Fig. 2) to receive solid contaminated waste matter. The solid radioactive waste matter is packed inside the chamber in a plastic material and sealed hermetically. It then comes to the receptacle which is put on a small hand-cart (Figs. 2 and 3). This process is described in detail. The waste container is made of carbon steel and has a capacity of 10 liters. A container of the type 10KЖО (10KZhO) is used for contaminated water and liquids. It is described in the preceding paper on a wash cabinet (pp. 341 - 344, Fig. 3). It is briefly described also here. There are 5 figures. X

TITLE: New universal chamber for handling α -, β -, and γ -active materials

PERIODICAL: Atomnaya energiya, v. 10, no. 4, 1961, 420-421

TEXT: A brief description is given of a new Russian universal chamber designed for handling hot substances. It consists of two chambers, one of type 1-KHM (1-KNZh) and the other of type KW (KSh), which are connected by a pre-chamber. The first chamber is used to handle α - and β -active materials, while the second one serves for work with γ -active materials of up to 50 mg-equiv. Ra; it has a biological shield. The first chamber has a volume of 0.4 m³, and the second chamber has one of 0.6 m³. Air can be fully exchanged 25 times per hour. The filter areas of the two chambers are 0.11 and 0.25 m², respectively. Dimensions of the universal chamber: 2970 x 2560 x 2320 mm; weight: 5700 kg (450 kg + 5250 kg). The 1-KNZh chamber has already been described in Ref. 1 (Lokhanin, Sinitsyn).

New universal chamber...

Atomnaya energiya, 2, vyp. 4, str 344 (1960)). Radioactive material is transferred from one chamber into the other through the pre-chamber. The KSh chamber is equipped with manipulators of the type **МШЛ-05** (MShL-05), an instrument box, daylight lamps, a manometer of the type **ТНМ-890** (TNM-890), two-stage filters, several vessels and containers, power supply lines, pipes for hot and cold water, sewers, and waste cans. The KSh chamber has a size of 1700 × 2540 × 2485 mm. Its biological shield consists of cast-iron plates having a thickness of 100 mm (front), 80 mm (sides and bottom), and 50 mm (top, back, and in between), and of several lead glasses (total thickness: 150 mm). The base of the chamber is made of carbon steel and has a size of 1700 × 980 × 940 mm. The two-stage filter used for air cleaning consists of a glass fabric 200 mm thick and four layers of the fabric **ФПП-15-1,7** (FPP-15-1.7). The filter cleans 25 m³ of air per hour. The pre-chamber is made of stainless steel of the type **1Х18Н9Т** (1Kh18N9T) and 450 × 706 × 732 mm large. The operating part of the chamber is made of stainless steel 3 mm thick and has a size of 900 × 706 × 725 mm. The waste containers are of the type 10 **КЗО** (10 KZhO). TITLE: Injection of plasma from a strong pulsed discharge into a vacuum

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 41, no. 5(11), 1961, 1340-1346

TEXT: The authors describe experiments carried out with two plasma injection devices: a small and a bigger one (Figs. 1 and 2). The bigger device in difference from the smaller has two diaphragms with apertures of 5 and 10 mm separating the observation chamber from the discharge chamber. The injection of plasma from a strong pulsed discharge into hydrogen (0.1-1.0 mm Hg) was studied. The capacitance of the discharge circuit of the small device was 40 μ F, the voltage was 20-30 kv and the maximum discharge current was 400 ka. The capacitance of the discharge circuit of the bigger device was 80 μ F, the voltage was 30-40 kv, and the maximum discharge current was 500 ka. The plasma parameters at different injector conditions were determined photoelectrically together with a temperature-

TITLE: Dynamic stabilization of a plasma pinch

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 48, no. 4, 1965, 1071-1076

TOPIC TAGS: plasma pinch, dynamic stabilization, plasma stability, high frequency plasma stabilization

ABSTRACT: Experiments are described, in which dynamic stabilization of a pinch carrying currents up to 10⁵ A has been observed in a hydrogen plasma. The experimental apparatus is shown in Fig. 1 of the Enclosure and consists of a main discharge circuit and a stabilizing circuit. The parameters of the main circuit are $C_1 = 30\text{--}45 \mu\text{F}$, $U = 5\text{--}10 \text{ kV}$, and $T = 20\text{--}24 \mu\text{sec}$. The discharge chamber is filled with hydrogen to a pressure 0.05--0.1 mm Hg. The stabilizing circuit is made up of six axial copper rods insulated from the electrodes and from the plasma, comprising an inductive load fed from a capacitor bank controlled by a vacuum trigger whose operation can be shifted relative to the initiation of the main discharge by a

Card 1/3

L 52955-65

ACCESSION NR: AP5010500

specified time interval for optimum stabilization. The placement of the stabilizing rods inside the chamber (close to the pinch) represents an attempt to extend the range of dynamic stabilization to higher values of the current. By means of a high-speed framing camera and magnetic probes, it was established that the instabilities inherent to a current-carrying pinch are inhibited if certain conditions with respect to long perturbations are satisfied. These conditions were formulated by one of the authors earlier (Osoverts, ZhETF v. 39, 311, 1960). "The authors thank A. M. Andrianov for valuable advice and useful discussions." TITLE: Inhibition of instabilities in a plasma column

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 51, no. 1, 1966, 87-94

TOPIC TAGS: plasma column, plasma instability, plasma stability

ABSTRACT: It is shown experimentally that under certain conditions a straight plasma column carrying a current of 100—120 kA can be stabilized by busbars employing a rapidly varying magnetic field. The stabilizing contour consists of six busbars arranged symmetrically on the outer surface of the discharge chamber, which has a diameter of 20 cm. The conclusion regarding the stabilization effect is drawn on the basis of data obtained by streak photography of the radiation, magnetic probe measurements, and recordings by a magnetic element of the amount of energy escaping to the chamber walls. Gold in the eastern Tarbagatal. V. M. Sinitsyn and G. M. Gapeeva. *Mim. soc. russ. mineral. Ser. 2, 66*, No. 1, 90-103, 1939; *Khim. Refeval. Zhur. 1939*, No. 8, 23. -- The main deposits represented by quartz veins with chalcopryrite and pyrite are not numerous. Au is found in pyrite, chalcopryrite and arsenopryrite which are contained in quartz-like rocks that represent the contact zone of the variscite intrusions. By weathering of the formations Au is transported to the surface deposits along the river banks. The deposits of the rivers Ters-Atryk, Tomysryk, Dzhalanash, Balatsu and Khigur-Bulak are of the greatest interest.

USSR/Geology- Geosynclines

"

Some Basic Problems of Geosynclines," A. V. Peyve, V. M. Siritsyn

"IZ Ak Nauk SSSR, Ser Geol" No 4, pp 28-52

From long personal investigations in Central Asia, Kazakhstan, Urals and Caucasus, authors develop new ideas on origin, development, and structure of geo-synclines and platforms. Before Upper-Proterozoic era they developed a single metamorphic continental shell, "panplatform," common for future geosynclines and platforms. At beginning of era, after sharp change in evolution of all geological processes, geosynclinal stage of development of earth's structure began. Consisted of several qualitatively different stages. Discusses general characteristics of stages of development of geosynclinal regions.

Title : Geological history of the Lobnorsk plain and the Lob Nor Lake

Periodical : Izv. AN SSSR. Ser. geol. 6, 30-42, Nov-Dec 1954

Abstract : Using the data of various investigations the author presents a brief history on the development of the Lob Nor plain and he arrives at the conclusion that the episodic displacements of the Lob Nor Lake are explained by tectonic motions which appear non-uniform in various parts of the Tarimsk depression. The Lob Nor plain is situated at the eastern tip of the Tarimsk depression running along the western regions of Central Asia. TITLE: Geographical Observations in ~~High-altitude~~ Regions of Central Asia
(Geograficheskiye nablyudeniya v vysokoy Azii)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geograficheskaya, 1958,
Nr 3, pp 37 - 47 (USSR)

ABSTRACT: In summer 1956, a team of geologists from the Geological Institute of the Chinese People's Republic Academy of Sciences crossed High Asia (a territory of 2,500,000 square kilometers in Central Asia including the Highland of Tibet surrounded by the mountain chains of Kun'lun' and the Himalayas) along the recently built Tsinkhay-Tibet highway. The only Soviet participant was the author of this article, V.M. Sinitsyn, who gives a detailed description of his observations. The author subdivides his article into the following parts: 1) the latest orographic structure of High Asia, 2) climate, 3) the hydrographic network, 4) glaciations. There are 4 maps and 10 references, 6 of which are Soviet, 3 English and 1 German.

TITLE: Tyan'-Shan'. Major Tectonic Elements (Tyan'-Shan'. Glavneyshiye elementy tektoniki)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geologicheskaya, 1958, ²³Nr 4, pp 3-17 (USSR)

ABSTRACT: Tyan'-Shan', one of the largest mountain systems of Asia, is a huge Paleozoic folding formation, composed of a large number of separate tectonic zones, differing in age, structure, deposits, and magmatic occurrences. The zoning of its tectonics is expressed in the interlocation of structures of Caledonian and Hercynian stages. The caledonites form one fully separated belt which can be traced along the whole length of the range. The hercynites form two belts - southern and northern - which border the Caledonian body. The structure of caledonites is very complicated and has been insufficiently studied. Generally speaking, the whole system of the Lower-Paleozoic folding, with the fragments of pre-Paleozoic structures and large regions of expansion of epi-Caledonian Middle-Paleozoic formations, are attached to the caledonites. The relative importance of fragments of pre-Cambrian structure in the Caledonian structure was taken by one of the authors (Ref. 14) as a criterion for sub-

Card 1/3

Tyan'-Shan'. Major Tectonic Elements

11-58-4-1/16

dividing the Caledonian folding zone into three parts: the Karatau-Talass, Sussamyr and Narat regions. A special feature of the stratigraphic columnar section of the folding zone is a large expanse of thick Lower-Paleozoic strata, an important development of pre-Cambrian strata and secondarily important Middle-Paleozoic deposits. In the Lower-Paleozoic strata, all the Cambrian and Ordovician formations are found, represented mostly by terrigenous deposits and to a lesser part - by carbonaceous and volcanogenous rocks. The magmatism of the Caledonites is exhibited by the domination of granitoids and by the rarity of basic and ultra-basic intrusions. The Hercynites, which form two belts - southern and northern - represent a complex of usually small folding zones of various age, all along the Middle and Upper Paleozoic. There are three distinct age-groups: early Hercynites formed during the Silurian and early Devonian periods; middle Hercynites - of Lower and Middle Carboniferous periods and late Hercynites - of Upper Carboniferous and Permian periods. The northern Hercynian belt is mainly in China. Only the Djungarian (Dzhungarskiy) Alatau range of mountains belongs to the USSR. The folding structure of its central part belongs to the oldest formations. It is formed by thick sand-shistous strata of Devonian age. The southern

Card 2/3

Tyan'-Shan'. Major Tectonic Elements

11-58-4-1/16

belt of the Hercynian folding zone begins at 92nd meridian and extends to the west for 2,000 km reaching the Kyzyl-Kum plain. It is formed by hercynites of three age groups (as above). The early hercynites extend along the southern ranges of Tyan'-Shan' from the Lob-Nor lake to the Fergan range. The middle hercynites form the Chatkal and Kavak zones and the zone of elevated foot-hills of the northern slopes of the Altay range. The Chatkal zone includes the Chatkal, Pskem, partly Ugam, Atoynak and Ferganian mountain ranges. The Kavak zone includes the structures of mountains in the middle part of the Karyn River. The late hercynites in the southern branch of Tyan'-Shan' form the South-Gissar, Surmetash, Kara-Chetyr, Karzhan-tau - Kuramin, Dzhamandavan and Aksay (Waydan-Tag) zones, formed in the Upper-Carboniferous and Permian periods. The authors describe in detail all these zones. There are 1 map and 15 Soviet references.

TITLE: ~~The Development of the Ideas of Academician V.A. Obruchev~~
in the Recent Investigations of Central Asia (Razvitiye idey.
akad. V.A. Obrucheva v noveyshikh issledovaniyakh tsentral'
noy Azii)

PERIODICAL: Izvestiya Vsesoyuznogo geograficheskogo obshchestva, 1958,
Vol 90, Nr 6, pp 521 - 530 (USSR)

ABSTRACT: This article is based on ideas formulated by the late Aca-
demician V. A. Obruchev who indicated ways of solving
problems of the geology and geography of Central Asia. The
article deals with two main problems to which Obruchev de-
voted much attention, i.e. the origin of loess, and recent
movements of the Earth crust. Obruchev propounded the the-
ory of the eolian origin of Central Asiatic loess and he
considered that loess layers are dissimilar with respect
to their composition, structure, occurrence and origin.
They can be divided into two categories: typical loess, i.e.
unstratified formations originating from dust deposits,
transported by winds from deserts; and loess-like strati-
fied layers, deposited by water. He assumed that loess

Card 1/3

SOV/12-90-6-3/23

The Development of the Ideas of Academician V.A. Obruchev in the Recent Investigations of Central Asia

was accumulated during the glaciation epoch and that the transformation of loess into loess-like layers was caused by the subsequent humidification of the climate in connection with recent movements. There exist three types of loess: loess of mountainous areas, highland loess and loess in alluvial plains. These types are analyzed and the conclusion is made that in mountainous areas eolian loess is prevalent, that the occurrence of proluvial-alluvial loess is developed in high-lands and is also prevalent in the Tarim Plain. Loess accumulation was a continuous process which took place during an extended period of the Quaternary, and in some regions is still going on. The second problem treated by Obruchev was the recent movement of the Earth crust occurring in the Neocene and Quaternary epochs. He proved that these movements have a considerable effect on the development of the actual Earth relief, which can be particularly well observed in the Central Asiatic region. He proved furthermore that recent movements affect the character and structure of the hydro-geographical network, sub-

The Development of the Ideas of Academician V.A. Obruchev in the Recent
.Investigations of Central Asia

terrestrial water movements, the climate and the development of organic life. These theories were confirmed by the latest investigations. Obruchev's theories on the movement of the Earth crust explain the tectonic nature and morphology of Central Asiatic mountains. There are 1 map and 10 references, 9 of which are Soviet and 1 German.

TITLE:

Mongolian-Siberian Anticyclone and the Regional Zonality of
Eolian Deposits of Central Asia (Mongolo-sibirskiy antitsik-
lon i regional'naya zonal'nost' eolovykh otlozheniy Tsentral'-
noy Azii)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 6, pp 1326-1328
(USSR)

ABSTRACT:

The Mongolian-Siberian maximum forms in the winter the baric
main centre of Eurasia. It is formed in consequence of an
extremely intense cooling and condensation of the air over
East Siberia and North Mongolia. The known maximum pressure
on the whole globe is bound to this region: Irkutsk 810 mm.
Furthermore, an extremely intense anticyclone air circulation
(like in the title) is related to this maximum which propagates
over Central Asia and South-East Europe. The masses of dense,
dry, and cold air formed in the above-mentioned region become
mobile in the peripheral regions and flow to the regions
with lower pressure. The main current flows to Central Asia
where the air over the deserts is especially heated and thin.
The low Khangay chain as well as the eastern Altay spurs are
easily passed. So this air appears in the Gobi plains and

Card 1/4

Mongolian-Siberian Anticyclone and the Regional Zonality SOV/20-125-6-43/61
of Eolian Deposits of Central Asia

dries and cools them in the extreme. The anticyclone which is only 3,000 m high is now almost turned aside by the chains of the Kuen'-lun' and Nan'shan' (6,000m and more) into the latitudinal direction (the depressions of the 40th parallel), partly towards the east - towards Alashan' and Ordos, partly towards the west - to the Tarim basin. This anticyclone is destroyed in spring, in summer, however, the air over the Central Asiatic deserts is heated. A region of low pressure is formed into which currents of humid air penetrate from the Atlantic and Pacific. The air loses, however, almost its entire humidity on the exterior slopes of the border mountains. Over the Gobi the resultant dry marine air masses assume quickly the properties of local air. Thus, dry continental air is preserved during the whole year over Central Asia. This is the reason of the maximum degree of aridity of its climate. The processes of denudation are very weak here in consequence of the few water courses, they almost stop. Winds are, however, very strong and frequent. They are able to do geological work. Not solidified and weakly cemented sediments are blown away, sands whirled up, loess dust clouds

Card 2/4

Mongolian-Siberian Anticyclone and the Regional
Zonality of Eolian Deposits of Central Asia

SOV/20-125-6-43/61

blown up, and even parent rocks corroded. Therefore the quaternary envelope consists mainly of formations of eolian origin. This work is, however, done by the air currents related to the afore-mentioned anticyclone. This is shown by the zonal distribution of eolian deposits. They lack in the North Mongolia which lies in the region of the formation of the anticyclone and has therefore no considerable atmospheric movements. The air masses in the lake plains of West Mongolia and in the East Gobi depression become more and more mobile till they have assumed the physical properties of local air and the winds die down. Figure 1 shows the zones. A small belt of sand deserts exists in the north where the anticyclone is formed. Vast desert plateaus of stones - hammadas - lie in the following zone where the wind attains its maximum intensity. A broad belt of the southern sand deserts: Takla-Makan, Dzosotyn-Elisu (Dzungaria) and Badanchzhareng (Alaschan') lies on the further way of the anticyclone current. Here the wind is not able to move the sand so that it is accumulated in gigantic quantities. These deserts are followed up by an accumulation zone of eolian loess:

Card 3/4

Mongolian-Siberian Anticyclone and the Regional
Zonality of Eolian Deposits of Central Asia

SOV/20-125-6-43/61

the northern slope of Kuen'lun', East-Kan'su platform,
North Shensi, etc. The dunes reflect the direction of the
anticyclone. Finally, it was detected that the Mongolo-
Sibirskiy anticyclone existed during the whole postglacial
period, i.e. 12-15,000 years. There is 1 figure.

Zashchita ot sredstv massovogo porazheniya (Defense Against Weapons of Mass
Destruction) Moscow, Uchpedgiz, 1958. 181 p. 100,000 copies printed.

Eds. (Title page): Sinshchyn, V.P. Candidate of Technical Sciences and Malinin, G.A.
Ed. (Inside book): Lavrovskiy, K.F.; Tech. Ed: Natapov, M.I.

PURPOSE: This book is intended for public instructors of the PVO DOSAAF
(Antiaircraft Defense Unit of the All-Union Voluntary Society for the
Promotion of the Army, Aviation and Navy).

COVERAGE: This book includes general information on atomic, chemical and bacteri-
ological weapons and measures for individual and collective protection from them.
The various authors contributed to the text as follows: M.Ye. Levin wrote Chap-
ters 1,2,3,4 and 6; M.N. Mandrazhitskiy - Chapters 7,8 and 9; G.A. Malinin -
Chapter 10; V.P. Sinitsyn - Chapters 11, 12, and 14; and V.I. Fedorov - Chapter 5.

Zashchita ot sredstv massovogo porazheniya (Protection Against Means of Mass Destruction) 2nd ed. Moscow, Uchpedgiz, 1960. 176 p. 50,000 copies printed.

General Ed.: V. P. Sinit syn, Candidate of Technical Sciences, and G. A. Malinin. Ed.: A. A. Korotkiy; Tech. Ed.: R. V. Tsypko.

PURPOSE: This book is intended for the public instructors of PVO DOSAAF (Air Defence Organization under the All-Union Voluntary Society for the Promotion of the Army, Aviation and Navy).

COVERAGE: The book gives fundamental information on atomic, chemical, and bacteriological weapons and on means of individual and collective protection. It states that the problem has been studied sufficiently and that at the present time adequate means of protection exist for a well-organized and trained population.. No personalities are mentioned. There are no references.

TITLE: The separate measurement of energy losses from a plasma due to radiation and through particles.

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 32, no. 11, 1962, 1406-1408

TEXT: According to the estimates of V. I. Kogan, a 1 cm layer of hydrogen at a pressure of ~ 0.1 mm Hg absorbs practically no radiation from a plasma, whereas it completely absorbs particles having energies between 50 and 100 ev. Here preliminary results of experiments are given in which this effect is used for separately measuring the energy spectrum of the radiation and of the particles, with the help of a bolometer and a gas filter. The experiments were carried out with a toroidal discharge chamber of type "Beta": inner diameter of the discharge chamber 21.6 cm, longitudinal field $H_z = 600$ oersteds, maximum discharge current 65 ka, intensity of the eddy electric field ~ 4 v/cm, pressure $(3-4) \cdot 10^{-3}$ mm Hg, discharge time ~ 0.8 msec. The measuring chamber (Fig. 1) is an aluminum box in the form of a cone enclosing the bolometer. The bolometer is

Card 1/3

The separate measurement of ...

S/057/62/032/011/014/014
B104/B102

mounted on the end of a movable copper rod enabling it to be moved along the axis of the chamber. If E_0 is the energy striking a unit area of the bolometer, and E_p the energy striking unit area of the chamber walls, the energy E_k which is incident on the chamber wall is given by $E_k = k(R)E_0(R)$, where $k(R)$ is a factor which takes account of the solid angle between the bolometer surface and the plasma, and R is the distance between the center of the discharge chamber and the bolometer. Information about the energy loss caused by the particles (E_p) is obtained from the dependence of E_k/E_0 on R (Fig. 3). After two days of vacuum treatment E_p is found to be $\approx 60\%$; after three days $\approx 40\%$. There are 3 figures.

TITLE: Investigation of plasma in an "Orekh" magnetic trap with the
aid of special bolometers

SOURCE: Diagnostika plazmy* (Plasma diagnostics); sb. statey.
Moscow, Gosatomizdat, 1963, 270-273

TOPIC TAGS: plasma magnetic field, magnetic mirror, plasma con-
finement, bolometer, thin film

ABSTRACT: The spatial and time distributions of heat flow from the
wall of a magnetic-trap vacuum chamber with a field that increases
towards the periphery were investigated to ascertain the influence
of the region near the point of zero field in the escape of charged
particles at low plasma concentrations, and also the character of

Card 1/5

ACCESSION NR: AT4025318

time variation of the width of an annular magnetic slot. Several specially developed bismuth bolometers were used to measure the heat flow from an "Orekh" magnetic trap. The bolometer constructions are described. Measurements of the magnetic gap have shown that the width of the gap is larger at small values of the magnetic field, and the experimentally observed broadening of the magnetic gap can be sufficiently well explained by classical diffusion. The escape of plasma particles was measured by introducing a metallic cylinder into the trap and measuring the heat escaping through the magnetic gaps with germanium bolometers. In the case of the first configuration of the magnetic field in the trap it was found that the particle escape from the system is due to loss of the adiabatic invariant on entering the region of weak magnetic field near the center, whereas in the case of the second configuration the plasma is essentially concentrated in the region of the weak magnetic field near the center. Thin film bolometers were also used to measure the escape of heat from the trap for plasma of high density ($\sim 10^{14} \text{ cm}^{-3}$)

Card 2/5

ACCESSION NR: AT4025318

and low density (10^{12} cm^{-3}). The escape times were found to be 60--70 and 150--200 microseconds, respectively. The bolometers described can be used to solve various problems in plasma physics. Orig. art. has: 2 figures.

AUTHOR: Gorelik, L.L.; Sinitsyn, V.V.

TITLE: New three-layer bolometers for measuring energy losses in plasmas

SOURCE: Zhurnal tekhnicheskoy fiziki, v.34, no.3, 1964, 505-508

TOPIC TAGS: bolometer, three-layer bolometer, high time resolution bolometer, plasma, plasma energy loss, plasma energy loss measurement

ABSTRACT: This paper describes three types of bolometer having sensitivities from 10^{-4} to 10^{-6} Joule/cm² and resolving times of the order of one microsecond. These bolometers are refinements of the three-layer 10^{-3} Joule/cm² 10-microsec bolometers described in detail in an accompanying paper (L.L.Gorelik, ZhTF, 34, No.3, 496, 1964 - see Abstract AP4020579). 1) A bismuth--aluminum oxide--aluminum bolometer is described which has an equilibration time of less than 2 microsec and an electrical time constant (RC product) of about one microsec. This bolometer differs from those described in the accompanying paper chiefly in size (the present bolometer measures 3×0.7 cm²) and in the care with which the components were desiccated at various stages of construction. 2) A germanium--aluminum oxide--aluminum bolometer is des-

Card 1/3

ACC.NR: AP4020580

cribed which has a sensitivity of 10^{-5} to 10^{-6} Joule/cm². The electrical time constant is negligible, but the equilibration time is about 40 microsec. The oxide coated aluminum foil (oxide layer 5 microns thick) was prepared as described in the accompanying paper. The germanium thermal sensitive element was vacuum deposited for 10 to 15 minutes at 1200°C and 3×10^{-4} mm Hg. It is believed that better and more consistent results can be obtained by depositing under a higher vacuum. The resistance of the germanium bolometer varies with the surrounding gas pressure. This does not affect its usefulness for the contemplated plasma measurements (see accompanying article cited above). 3) A bismuth--collodion--silver bolometer is described which has a sensitivity of 10^{-5} to 10^{-6} Joule/cm², an electrical time constant of about 1 microsec, and an equilibration time of less than 0.1 microsec. The bolometer was constructed on a $7 \times 15 \times 0.7$ mm³ oxidized dural frame having a 5×10 mm² opening, one side of which was chamfered. A collodion film 0.2 to 0.3 microns thick was deposited on this frame by a process that is not described. A 0.1 micron silver film was vacuum deposited on the side of the collodion film facing the chamfered side of the frame. This serves as the heat collector. The Bi-Pb (0.6% Pb) thermal element was vacuum deposited on the other side of the collodion film. "In conclusion the authors express their gratitude to I.K.Kikoin for his interest in the work and for

Effect of a magnetic field on the heat conductivity of gases
with nonspherical molecules. Zhur. eksp. i teor. fiz. 48
no.2:761-765 P '65. (MIRA 18:11)

ACCESSION NR: AP4012573

S/0056/64/046/001/0401/0402

AUTHORS: Gorelik, L. L.; Sinitsyn, V. V.

TITLE: Influence of a magnetic field on the thermal conductivity of gases with nonspherical molecules

SOURCE: Zhurnal eksper. i teoret. fiz., v. 46, no. 1, 1964, 401-402

TOPIC TAGS: nitrogen molecule, paramagnetic gas, diatomic gas, nonspherical molecule, thermal conductivity, effect of magnetic field, effective magnetic moment, nuclear magnetic moment, Senftleben effect, rotational magnetic moment, viscosity

ABSTRACT: Preliminary results of an investigation of the influence of a magnetic field on the thermal conductivity of N_2 are reported.

The apparatus used is similar to the oxygen gas analyzer with magnetic field described by L. L. Gorelik (ZhTF v. 33, no. 12, 1963).

Card 1/4

ACCESSION NR: AP4012573

The change of the thermal conductivity could be judged from the bridge unbalance upon application of the magnetic field. The measurements were in fields up to 340 Oe at a pressure of 3.5×10^{-2} mm Hg. The plot of the relative change ($\Delta\lambda/\lambda$) of the thermal conductivity against H/p (H -- magnetic field, p -- pressure) shows similarity to both the plot of viscosity vs. H/p (J. J. Beenakker et al, Phys. Lett. v. 2, 5, 1962) and to the corresponding plot for oxygen (E. Rieger, Ann. d. Phys. v. 31, 453, 1938), but there is a slight discrepancy between the effective magnetic moment of the nitrogen molecule and that calculated on the basis of the experiment. This suggests that the effect observed in nitrogen is due to rotational as well as to nuclear magnetic moments. More accurate measurements on nitrogen and other gases are planned. "The authors are grateful to I. K. Kikoin, Yu. M. Kagan, A. A. Sazy*kin, and L. A. Maksimov for valuable discussions and advice, to V. Kh. Volkov for interest and help, and to V. I. Nikolayev for constant help in making the instruments and measurements. The authors are also grateful to L. D.
